

AWS Lambda Lab(S3+Lambda)

12 August 2026 12:10

UPDATED - Create Your First AWS Lambda Function | AWS Tutorial for Beginners

Create an S3 bucket and Lambda Function (Select Python 3.12)

Paste this code in Lambda Function

```
import json
import urllib.parse
import boto3
print('Loading function')
s3 = boto3.client('s3')

def lambda_handler(event, context):
    #print("Received event: " + json.dumps(event, indent=2))
    # Get the object from the event and show its content type
    bucket = event['Records'][0]['s3']['bucket']['name']
    key = urllib.parse.unquote_plus(event['Records'][0]['s3']
    ['object']['key'], encoding='utf-8')
    try:
        response = s3.get_object(Bucket=bucket, Key=key)
        print("CONTENT TYPE: " + response['ContentType'])
        return response['ContentType']
    except Exception as e:
        print(e)
        print('Error getting object {} from bucket {}. Make sure
they exist and your bucket is in the same region as this
function.'.format(key, bucket))
        raise e
```

Successfully created the function "lambdas3-function". You can now change its code and configuration. To invoke your function with a test event, choose "Test".
