

AWS S3 + Lambda Lab Manual

Objective

Create an S3 bucket that triggers an AWS Lambda function when a file is uploaded.

Architecture

User -> Amazon S3 (ObjectCreated event) -> AWS Lambda -> CloudWatch Logs

Prerequisites

AWS account, IAM permissions, Python 3.12 runtime.

Steps

1. Sign in to AWS Console.
2. Open S3 and create a bucket with a unique name.
3. Upload a test file.
4. Open Lambda and create a function from scratch.
5. Select Python runtime and an execution role with basic Lambda permissions.
6. Paste sample code:

```
def lambda_handler(event, context):  
    print(event)  
    return {'statusCode':200}
```
7. Add S3 trigger (ObjectCreated:All).
8. Upload another file to S3.
9. Open CloudWatch Logs and verify the event was logged.
10. Delete resources after testing.

Expected Result

Each upload to the bucket invokes Lambda and creates a CloudWatch log entry.

Screenshot Placeholders

Capture these from your AWS Console: 1. S3 Create Bucket 2. Bucket Upload 3. Lambda Create Function 4. Add Trigger 5. CloudWatch Logs
