

Docker Containerize a Simple Springboot project

01 August 2026 12:46

Step 1: Create your springboot application

```
springboot-app/
├── .mvn/
│   └── wrapper/
│       ├── maven-wrapper.jar
│       └── maven-wrapper.properties
├── src/
│   ├── main/
│   │   ├── java/
│   │   │   ├── com/
│   │   │   │   ├── example/
│   │   │   │   │   ├── springbootapp/
│   │   │   │   │   │   ├── SpringBootApplicationApplication.java
│   │   │   │   │   │   ├── controller/
│   │   │   │   │   │   │   ├── HomeController.java
│   │   │   │   │   │   ├── service/
│   │   │   │   │   │   │   ├── UserService.java
│   │   │   │   │   │   ├── repository/
│   │   │   │   │   │   │   ├── UserRepository.java
│   │   │   │   │   │   ├── entity/
│   │   │   │   │   │   │   ├── User.java
│   │   │   │   │   │   ├── dto/
│   │   │   │   │   │   │   ├── UserRequest.java
│   │   │   │   │   │   │   ├── UserResponse.java
│   │   │   │   │   │   ├── config/
│   │   │   │   │   │   │   ├── SecurityConfig.java

├── README.md
└── HELP.md

```

Step2:Build the JAR File

If you're using Maven:

```
mvn clean package
```

or

```
./mvnw clean package
```

After building:

```
target/
  springboot-app-0.0.1-SNAPSHOT.jar
```

This JAR contains your complete application.

Step3:Create a Dockerfile

Inside the project root, create a file named:

Dockerfile
Example:

```
FROM eclipse-temurin:21-jdk
WORKDIR /app
COPY target/*.jar app.jar
EXPOSE 8080
ENTRYPOINT ["java","-jar","app.jar"]
```

What each line means

Base Image

FROM eclipse-temurin:21-jdk
Downloads an image containing Java 21-> check the java version before you are creating a springboot project

Working Directory

WORKDIR /app
Creates /app inside the container.
Everything runs from here.

Copy JAR

COPY target/*.jar app.jar
Copies

target/myproject.jar
to

/app/app.jar
inside the container.

Expose Port

EXPOSE 8080
Spring Boot runs on port **8080** by default.

Start Application

ENTRYPOINT ["java", "-jar", "app.jar"]
When the container starts, it runs:

```
java -jar app.jar
```

Step4: Build a docker image

Open CMD go the file path

```
docker build -t springboot-app .
```

Notice the .
It means:

Build using the Dockerfile in the current directory.

Example output:

```
Successfully built 1ab23cd456ef  
Successfully tagged springboot-app:latest
```

Step5: Verify the image

docker images

Output:

REPOSITORY	TAG	IMAGE ID
springboot-app	latest	a12345bc678

Step6: Run the Container

```
docker run -d -p 8080:8080 --name spring-container springboot-app
```

here,
spring-container

Check the port number inside the dockerfile for which you have created!!

Explanation:

-d
Runs in background.

-p 8080:8080

Maps:

Host Port 8080

Container Port 8080

--name spring-container

Names the container.

springboot-app

Image name.

Step7: Check Running Containers

docker ps

Step8: Access the containers

If the controller has:

@RestController

public class HomeController {

 @GetMapping("/")

 public String hello() {

 return "Hello Docker!";

 }

}

On the tab open <http://localhost:7890/hello>

Step9: View logs

docker logs spring-container

taskkill /PID 4892 /F -> to kill the port

Step10: Stop the container

docker stop spring-container

Step11: Start Again

docker start spring-container

Step12: Remove the container

docker rm spring-container

Step13: Remove the image

docker rmi springboot-app

Complete flow:

Write Spring Boot Code

mvn clean package

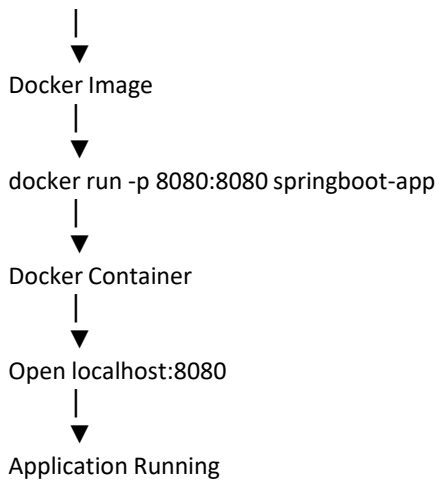

Creates JAR

Write Dockerfile

docker build -t springboot-app .

PowerShellProcess:
